Combination therapy outcomes vary by **treatment** sequence and baseline risk profiles

Nationwide study (MarketScan database, >250 million individuals)

GLP-1 RA initiators

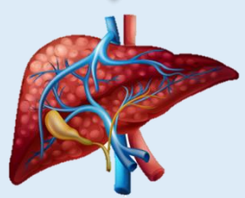

Predominant metabolic dysfunction (obesity, insulin resistance, hyperglycemia)

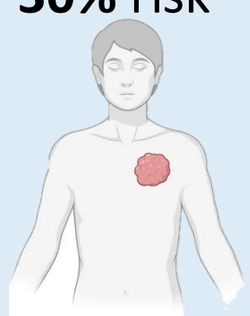

Add-on statin

GLP-1 RA initiators → Add-on statin vs GLP-1 RA monotherapy

Cirrhosis and Decompensated cirrhosis ↓ **~35%** risk

Non-liver cancers ↓ **~30%** risk

MASLD Population (multisystem disease)

Statin initiators

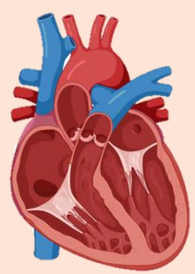

Predominant cardiovascular risk (dyslipidemia, atherosclerosis)

Add-on GLP-1 RA

Statin initiators → Add-on GLP-1 RA vs Statin monotherapy

Cardiovascular disease ↓ **~30%** risk

Decompensated cirrhosis ↓ **~20%** risk
